Project Proposal

For my final project, I'd like to create a site that replicates a simplified version of the *Pokedex*, which is essentially an encyclopedia for *Pokemon*. I found an API called PokeApi that I could use for the assignment, although there are a few other options for pokemon-based APIs if that one is not compatible for some reason.

The pokedex will consist of an image, the name and number of the pokemon, the pokemon's "scientific" name, the type(s) of the pokemon, and the pokedex info of the pokemon. I will try to make it look similar to the below screenshot. If things go well and smooth, I will add the footprints, along with the weight and heights. If things go REALLY well, then I will add the top portion, which brings up another slide that displays a map with the area the pokemon is found in.
